

Code Execution Guide

The Google Colab notebook is available in the project's GitHub repository. Due to the size of the dataset, the ZIP file containing the CSV files is stored in a public Google Drive folder.

1. Download the Project Files

Download the Google Colab notebook from the GitHub repository:

- `Final_Project_Eye_Tracking.ipynb`

Download the dataset from the following public Google Drive folder:

<https://drive.google.com/drive/folders/1Q1qqjBY8T3leJMSwc1dCakNJxQBqEg-B?usp=sharing>

Download the ZIP file containing the eye-tracking CSV files and extract it on your computer.

2. Upload the Dataset to Google Drive

Upload the extracted folder containing the CSV files to your personal Google Drive.

For example, the folder can be stored at:

My Drive/Eye-tracking Output

Make sure that the CSV files are located directly inside the uploaded folder.

3. Open the Notebook in Google Colab

1. Open Google Colab.
2. Select **File** → **Upload notebook**.
3. Upload the `Final_Project_Eye_Tracking.ipynb` file downloaded from GitHub.
4. Wait for the notebook to open.

Alternatively, the notebook can be opened directly from GitHub through Google Colab.

4. Connect Google Drive

Run the notebook cells until the Google Drive connection request appears.

Authorize Google Colab to access your Google Drive. After authorization, the files stored in your Drive will be accessible from the notebook.

5. Update the Dataset Path

Locate the following line in the notebook:

```
path = "/content/drive/MyDrive/Eye-tracking Output/*.csv"
```

Change the path according to the location of the CSV folder in your Google Drive.

For example, if the CSV files are stored in:

```
My Drive/Final Project/Dataset
```

update the path to:

```
path = "/content/drive/MyDrive/Final Project/Dataset/*.csv"
```

The dataset path may appear in more than one code section. Make sure to update all occurrences before running the entire notebook.

6. Run the Notebook

Select:

Runtime → Run all

The notebook will:

- Load the eye-tracking CSV files.
- Preprocess and clean the data.
- Extract the relevant eye-tracking features.
- Train and evaluate the machine-learning models.
- Display the numerical results and graphs.
